

# E-Unit

lockout switch

Item #517

Lockout Switch assembly is prewired and insulated with appropriate heat shrink tubing. Lockout switch will lock any DALLEE E-Unit into the Forward or Neutral position. The switch will prevent the E-Unit from sequencing beyond the startup position. If you have forward as your startup position, then with the switch engaged the E-Unit will start in forward. Likewise, if the startup is set for Neutral, then you will stay in Neutral. When the switch is set off, you will sequence as normal.

#### Installation:

Mount the switch in an appropriate location that allows the end connector to reach the existing E-Unit's "LOCK" connector. Drill a 7/32" hole. Using both nuts with the locking washer, mount the switch. Plug the connector into the "LOCK" socket on the E-Unit board. Refer to your E-Unit instructions for this location (usually in the top left of the E-Unit board). Be sure not to puncture or pinch either of these wires or the insulation around the switch. Doing so could damage the E-Unit.
