

Power Transformer

auto reset

Item #690

Green LED
overload indicator

Physical size:
3.2" l x 2.6"w x 2.3"h
(subject to change w/o notice)

screw terminals for wiring to the AC output.

This wall plug in power transformer is suitable for powering many items. It can be used for powering the Yard Master (item 354), LocoMatic™ systems operating in command mode (mode 3). For newer motors, this has enough power to operate a complete train with our LocoMatic™ sound & control system. Or use it to power several: 12VPS (item 369), RL-ADJ (item 379), VRS (item 378). Use a bridge rectifier (item 371) to make a DC supply capable of powering several polarity reverse switch machines, like the Lemaco shown above. Many applications.

Item 690 power transformer has an output of 16.5vAC, 2.42 Ampere's (40 watts). It has a Green indicator LED to show the status of the output voltage. Since it is equipped with an auto-resetting (PTC) switch, overload and overtemperature failures are automatically disconnected from the power transformer! This overload state is shown by the Green LED going dim to an off state. After the power transformer cools from the overload, the output is automatically restored. For best reset operation, it is recommended to turn the transformer off or at least disconnect the load from the transformer. This will allow the PTC to reset properly and quicker.
