

# INTERFACE

kit

Item #994

## REQUIRES SOLDERING!

Contains parts to make 4 inverters to interface receivers to the DALLEE sound systems.

Instructions shown are for the AristoCraft 75MHz radio receiver but can be used for any type receiver.

Premade units are also available, item 995. These still require soldering to the receiver connector.

"code set" switch connector

Receiver connector: since the mating connector is only available from the "far east" we have not been able to source it. Therefore, this requires soldering to the appropriate connections on the underside of this connector. The illustrations shown are from the top of the board, not the solder side. Soldering the required wires to the appropriate locations requires a proper pencil type solder iron and appropriate solder for electrical items (do not use any paste flux intended for plumbing!).
