

# INTERFACE

Item #995

## REQUIRES SOLDERING!

This circuit contains two inverters to interface receivers to the DALLEE sound systems.

Instructions shown are for the AristoCraft 75MHz radio receiver but can be used for any type receiver. For other type receivers, connect the Violet and Blue wires to the functions necessary for inverted operation. Connect the other wires as shown to J4 or J5 of the DALLEE sound system. The black wire must be connected to the common ground between the receiver and the sound system.

DO NOT put any strain on the wires coming out of the INTERFACE package, doing so will damage the unit.

"code set" switch connector

Receiver connector - since the mating connector is only available from the "far east" we have not been able to source it. Therefore, this requires soldering to the appropriate connections on the underside of this connector. The illustrations shown are from the top of the board, not the solder side. Soldering the required wires to the appropriate locations requires a proper pencil type solder iron and appropriate solder for electrical items (do not use any paste flux intended for plumbing!).
