

Using diode logic to control MO-1's with multiple detectors.

When SC2 is powered up, the MO1 is set to stop.

SC6 can also be used as well. When SC6 is set "ON" (by connecting to RI-DC, 5), MO1 is set to stop

These functions are described in the MO1 instructions as well.

Power to the TRAK-DTRL's must come from a 12VPS, item 369, and be wired properly to them and the SC2 MO-1 inputs.
