

## Changing sounds (Micro Controller's) on the DCv3 board.

Any DCv3 type main board can have it's sounds changed by merely changing the Micro Controller. This is easily done as shown below. A micro from any other board, or purchased separately, can be used in another board by switching the Micro Controller. This not only allows for changing the sounds but also for changing the type of operation, i.e. from "Auto-Play" to "Standard Play" type systems.
