

Announcing.....

New updated TRAK-DTL (Track Detector Latch) for operators in any gauge utilizing DC, DCC, AC, or any other types of track power. Including various command control systems.

The new Trak-DTL unit's basic features are:

- latches it's relay output ON for the first sense of current flow. After a period of no current flow, it will relax it's relay output on the next sense of current flow. This makes it ideal for applications requiring automatic reverse loops and automatic back-n-forth operation as well as automatic sequential operations.
- universal applications: DC track power, DCC track power, AC track power, command systems utilizing track power, or any other current sense application.
- provides complete isolation from the power sensed and the output with no interference to any control system.
- provides a DPDT, 5 ampere, relay output to drive many types of loads, from low current to high current.
- activates with small amounts of current flowing in the wire placed through the sense coil.
- deactivates faster than previous units and allows for faster reactivation time after deactivating.
- activation indicated via a RED LED.
- expansion port for our expansion relay board (item 555) is also provided yielding a 4PDT output.

All of our Trak-DT family requires regulated 12 volts DC to power the board properly. Our 12VPS, item 369, provides power for this function to multiple Trak-DT's. Item 990 is an excellent AC power source for multiple 12VPS units powering multiple Trak-DT's.

Trak-DTL, item 366, priced at \$29.95*.

* all orders require PA State sales tax if applicable and a shipping / handling / insurance charge (typically \$9.25).
